**Figure 9: Median Income in Sahastradhara for Different Age Brackets**

**Lorenz Curve and Gini Coefficient Detailed Explanation:**

Lorenz curve is a graph drawn between Cumulative percentage of income and Cumulative percentage of population. If there is no income disparity existing in a region then Lorenz curve is a straight line passing through the two axes at certain intercepts, but when any inequality arises in the region with regards to income distribution then the Lorenz curve caves below the straight line which is called the line of equality. This inequality is measured by the ratio between the area enclosed by the line of equality and the Lorenz curve. This is nothing but Gini Coefficient.

Higher the value of Gini coefficient, higher is the inequality in the region. It's value ranges from 0 to 1. 0 indicates that everyone in a region is earning equal income and 1 indicates that one or one set of people are earning all of the income in that region.
